Lecture 3

Querying Relational Databases Using SQL

basic SELECT query:

```
SELECT [DISTINCT] select-list FROM from-list WHERE qualification
```

select-list

• list of (expressions involving) attributes from relations in the from-list

• from-list

• list of relation names; each of them can be followed by a range variable

qualification

- selection conditions on the data from the relations in the from-list
- conditions (expr op expr, where op $\in \{<, \le, =, >, \ge, \ne\}$ and expr is an expression that can include attributes, constants, etc) combined with the logical operators AND, OR, NOT

basic SELECT query:

```
SELECT [DISTINCT] select-list FROM from-list WHERE qualification
```

- the SELECT, FROM clauses mandatory
- the WHERE clause optional

the conceptual evaluation strategy:

```
SELECT [DISTINCT] select-list
FROM from-list
WHERE qualification
```

- compute the cross product of tables in the from-list
- remove the rows that don't meet qualification
- eliminate unwanted columns, i.e., those that don't appear in the select-list
- if DISTINCT is specified, remove duplicates
 - by default, duplicates are not eliminated

examples on the schema

Researchers(<u>RID</u>: integer, Name: string, ImpactFactor: integer, Age*: integer)

Papers(<u>PID</u>: integer, *Title*: string, *Conference*: string)

AuthorContribution(*RID*: integer, *PID*: integer, *Year*: integer)

* we use the *Age* attribute for simplicity; it is preferable to store the date of birth, as it doesn't change every year

• Find the names of researchers who have worked on the paper with PID = 307.

SELECT R.Name

FROM Researchers R, AuthorContribution A

WHERE R.RID = A.RID AND A.PID = 307
